The somedefs toolkit package

Alan Jeffrey

long time ago in a different century...

This file is maintained by the LATEX Project team. Bug reports can be opened (category tools) at https://latex-project.org/bugs.html.

Overview

This is an example 'programmers toolkit' package, for use by package writers. It allows package writers to provide options which switch definitions on and off. For example, a package fred might define a large number of commands, including \foo and \baz, so:

\usepackage{fred}

would use a lot of memory, even if \foo and \baz were the only commands needed. However, if the author of fred used the somedefs package, then the user would be able to say:

\usepackage[only,foo,baz]{fred}

and only the commands \foo and \baz would be defined.

To use the somedefs package in your own packages or classes, you say:

\RequirePackage{somedefs}

You can then use four new commands:

- \UseAllDefinitions which says that all the commands in the file should be defined.
- \UseSomeDefinitions which says that only the commands specified by \UseDefinition should be defined.
- \UseDefinition{ $\langle name \rangle$ } which says that the command \name should be defined.
- \ProvidesDefinition{ $\langle definition \rangle$ } which provides one definition, of the form \definingcommand{\command}...

For example, the package fred could say:

```
\RequirePackage{somedefs}
\UseAllDefinitions
\DeclareOption{only}{\UseSomeDefinitions}
\DeclareOption*{\UseDefinition{\CurrentOption}}
\ProcessOptions
\ProvidesDefinition{\newcommand{\foo}{\ldots\}}
\ProvidesDefinition{\newcommand{\baz}{\ldots\}}
```

One of the commands \UseAllDefinitions or \UseSomeDefinitions should always be used. You may have some commands which need other commands, in which case you have to declare the options by hand. For example, if the command \bar needs the command \foo, you could say:

```
\DeclareOption{bar}{\UseDefinition{bar}\UseDefinition{foo}}
```

For a longer example of the use of the somedefs package, look at the rawfonts package.

                         This is a LATEX 2\varepsilon package.
                          7 (*package)
                          8 \NeedsTeXFormat{LaTeX2e}
                          9 \ProvidesPackage{somedefs}[1994/06/01 v0.03 Toolkit for optional definitions]
    \UseSomeDefinitions The package works by having \UseDefinition\{\langle name \rangle\} define \name to be
     \UseAllDefinitions \@unprovided@definition. If \UseSomeDefinitions has been called, then
         \UseDefinition \ProvidesDefinition looks to see if \name is \QunprovidedQdefinition. If
    \ProvidesDefinition \UseAllDefinitions has been called, then \ProvidesDefinition does nothing.
   \verb|\coloredge| Provides Definition| If neither has been called, then \verb|\Provides Definition| produces an error message.
