The file ltxdoc.dtx for use with LaTeX 2ε .* It contains the code for ltxdoc.cls

David Carlisle 2024/02/08

This file is maintained by the LATEX Project team. Bug reports can be opened (category latex) at https://latex-project.org/bugs.html.

1 Documentation of the LATEX sources

This class file is designed for documenting the LATEX source files. You may however find it generally useful as a class for typesetting the documentation of files produced in 'doc' format.

Each documented file in the standard distribution comes with extension dtx. The appropriate class package or initex file will be extracted from the source by the docstrip system. Each dtx file may be directly processed with \LaTeX 2 ε , for example

latex2e docclass.dtx

would produce the documentation of the Class and package interface.

Each file that is used in producing the \LaTeX format (ie not including the standard class and packages) will be printed together in one document if you \LaTeX the file <code>sources2e.tex</code>. This has the advantage that one can produce a full index of macro usage across all the source files.

If you need to customise the typesetting of any of these files, there are two options:

- You can use DOCSTRIP with the module 'driver' to extract a small LATEX file that you may edit to use whatever class or package options you require, before inputting the source file.
- You can create a file ltxdoc.cfg. This configuration file will be read whenever the ltxdoc class is used, and so can be used to customise the typesetting of all the source files, without having to edit lots of small driver files.

The second option is usually more convenient. Various possibilities are discussed in the next section.

^{*}This file has version number v2.1j, dated 2024/02/08.

2 Customisation

The simplest form of customisation is to pass more options to the article class which is loaded by ltxdoc. For instance if you wish all the documentation to be formatted for A4 paper, add the following line to ltxdoc.cfg:

\PassOptionsToClass{a4paper}{article}

All the source files are in two parts, separated by \MaybeStop. The first part (should) contain 'user' documentation. The second part is a full documented listing of the source code. The doc package provides the command \OnlyDescription which suppresses the code listings. This may also be used in the configuration file, but as the doc package is read later, you must delay the execution of \OnlyDescription until after the doc package has been read. The simplest way is to use \AtBeginDocument. Thus you could put the following in your ltxdoc.cfg.

\AtBeginDocument{\OnlyDescription}

If your document relies on using the old doc version, you can request that the class loads doc version 2 by passing the option doc2.

If the full source listing sources2e.tex is processed, then an index and change history are produced by default, however indexes are normally not produced for individual files.

As an example, consider ltclass.dtx, which contains the sources for the new class and package interface commands. With no cfg file, a 19 page document is produced. With the above configuration a slightly more readable document (4 pages) is produced.

Conversely, if you really want to read the source listings in detail, you will want to have an index. Again the index commands provided by the doc package may be used, but their execution must be delayed.

```
\AtBeginDocument{\CodelineIndex\EnableCrossrefs}\AtEndDocument{\PrintIndex}
```

The doc package writes index files to be sorted using MakeIndex with the gind style, so one would then use a command such as

```
makeindex -s gind.ist ltclass.idx
and re-run LATEX.
Similarly to print a Change history, you would add
\AtBeginDocument{\RecordChanges}
\AtEndDocument{\PrintChanges}
to ltxdoc.cfg, and use MakeIndex with a command such as
makeindex -s gglo.ist -o ltclass.gls ltclass.glo
```

Finally if you do not want to list all the sections of source2e.tex, you can use \includeonly in the cfg file:

```
\includeonly{ltvers,ltboxes}
```

3 Options

```
1 (*class)
2 \DeclareOption{a5paper}{\@latexerr{Option not supported}%
3 {}}

Prevent loading of a config file.
4 \newif\ifltxdoc@load@cfg@ \ltxdoc@load@cfg@true
5 \DeclareOption{nocfg}{\ltxdoc@load@cfg@false}

Support rolling back doc to version 2:
6 \let\ltxdoc@doc@version\@empty % use current version by default
7 \DeclareOption{doc2}{%
8 \def\ltxdoc@doc@version{=v2}%
9 \DeclareRobustCommand\cs[1]{\texttt{\bslash #1}}%
10 }

11 \DeclareOption*{%
12 \PassOptionsToClass {\CurrentOption}{article}}
```

4 Option Processing

13 \ProcessOptions

5 Local configuration

Input a local configuration file, if it exists.

```
14 \ifltxdoc@load@cfg@
15 \InputIfFileExists{ltxdoc.cfg}
        * Local config file ltxdoc.cfg used^^J%
17
              ***************************
18
19
20 \else
21
   22
        * Local config file ignored^^J%
23
        **********
24 \fi
```

6 Loading article and doc

```
25 \LoadClass{article}
```

By default, loadthe current doc version (\ltxdoc@doc@version is empty). If option doc2 is given version 2 is loaded (\ltxdoc@doc@version contains =v2).

26 \RequirePackage{doc}[\ltxdoc@doc@version]

Make | be a 'short verb' character, but not in the document preamble, where an active character may interfere with packages that are loaded.

27 \AtBeginDocument{\MakeShortVerb{\|}}

As 'doc' documents tend to have a lot of monospaced material, Set up some tt substitutions to occur silently.

```
28 \DeclareFontShape{OT1}{cmtt}{bx}{n}{<-> ssub * cmtt/m/n}{} 29 \DeclareFontFamily{OMS}{cmtt}{\skewchar\font 48} % '60  
30 \DeclareFontShape{OMS}{cmtt}{m}{n}{<-> ssub * cmsy/m/n}{}
```

```
31 \DeclareFontShape{OMS}{cmtt}{bx}{n}{<-> ssub * cmsy/b/n}{}
This substitution is in the standard fd file, but not silent.
32 \DeclareFontShape{OT1}{cmss}{m}{it}{<->ssub*cmss/m/s1}{}
33 \CodelineNumbered
34 \DisableCrossrefs
```

Increase the text width slightly so that with the standard fonts 72 columns of code may appear in a macrocode environment.

35 \setlength{\textwidth}{355pt}

Increase the marginpar width slightly, for long command names. And increase the left margin by a similar amount

```
36 \addtolength\marginparwidth{30pt}
```

- 37 \addtolength\oddsidemargin{20pt}
- 38 \addtolength\evensidemargin{20pt}
- 39 \setcounter{StandardModuleDepth}{1}

7 Useful abbreviations

\cmd{\foo} Prints \foo verbatim. It may be used inside moving arguments. It can not be used to record commands that are defined as "\outer" nor is it possible to use it on conditionals such as \iftrue or defined by \newif. \cs{foo} Already available with the doc package and also prints \foo, for those who prefer that syntax. (This second form can be used to record all types of command so the above restrictions do not apply.)

```
\cmd
  \cs
      40 %\DeclareRobustCommand\cs[1]...
                                                                     % defined later
       41 %\def\cmd#1{\cs{\expandafter\cmd@to@cs\string#1}}
                                                                     % can't use with new \cs
       42 \def\cmd#1{\texttt{\char'\\expandafter\cmd@to@cs\string#1}}
       43 \def\cmd@to@cs#1#2{\char\number'#2\relax}
\marg \marg{text} prints \{\langle text \rangle\}, 'mandatory argument'.
       44 \providecommand\marg[1]{%
       45 {\ttfamily\char'\{}\meta{#1}{\ttfamily\char'\}}}
\oarg \oarg{text} prints [\langle text \rangle], 'optional argument'.
       46 \providecommand\oarg[1]{%
       47 {\ttfamily[}\meta{#1}{\ttfamily]}}
\parg \parg{te,xt} prints (\langle te,xt \rangle), 'picture mode argument'.
       48 \providecommand\parg[1]{%
       49 {\ttfamily(}\meta{#1}{\ttfamily)}}
```

8 Old Comments

The \LaTeX Σ sources contain a lot of code inherited from \LaTeX 2.09. The comments in this code were not designed to be typeset, and do not contain the necessary \LaTeX markup. The oldcomments environment typesets these comments, automatically sensing when any control sequence appears, and implicitly adding the \checkmark This procedure does not produce particularly beautiful pages, but it

allows us to fully document new sections, and have some form of typeset comments on all the old code.

Scan control names and put them in tt. Will actually (incorrectly) scan past \\ but this does not matter as this is almost never followed by a letter in practice. (ie \\foo) would put foo in \ttfamily.

```

                         224
                         225 \left| 4f\right| 
                             Some features from l3doc.cls Eventually, \cs should get the definition from
                         13doc but for now we revert to the simple one from doc.
                         226 %\DeclareRobustCommand\cs[1]{\texttt{\bslash #1}}%
                                                                                                  -- def in doc.sty
                         227 \AtBeginDocument{%
                         228 % \renewcommand\PrintMacroName[1]{\MacroFont\string #1\}%
                                                                                                 -- def in doc.sty
                         We provide those delated in case somebody has loaded csquotes or makes some
```

definitions in the preamble.
