The tikzquads Package An Extension to Circui $\mathrm{Ti}k\mathrm{Z}$ Version 1.1

Alceu Frigeri*

October 2024

Abstract

This package defines a few extra shapes (single / dual port boxes) designed to be used together with the CircuiTikZ package.

1 Introduction

In standard text books, Circuits Theory and Electronics alike, quite frequently, in the process of modelling sub-circuits, one ends representing them either:

- as a single port black box, or
- as a dual port black box

This package defines a few, parameterized shapes for each case:

- for single port black boxes:
 - Black Box
 - Thevenin
 - Norton
- for dual port black boxes:
 - Quad
 - Quad Z
 - Quad Y
 - Quad G
 - Quad H

Lastly, this package also defines a *Pseudo-Graph load line* shape, for those moments where a true graph, like the ones *pgfplots* enables, isn't needed.

1.1 CircuiTikZ

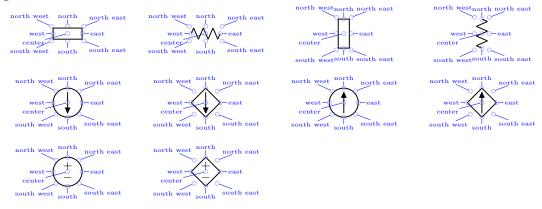

Unfortunately, some implementation details of these shapes don't follow the code structure adopted by <code>CircuiTikZ</code>, and some significant part of this package's code would have to be re-written if it were to be integrated directly in <code>CircuiTikZ</code>, and that's the main reason this is, for the time being, a separate package. After all, even though this doesn't follows <code>CircuiTikZ</code> code scheme, it does work nicely with it, as is.

2 Auxiliary Shapes and Basic Keys

Those shapes are not intended for end users.

2.1 Auxiliary shapes

A set of auxiliary shapes are defined, but not meant to be used otherwise, though their anchors might be relevant:

Note: The point being that, regardless of the sub-shape orientation, the intuitive geographical coordinates applies.

2.2 General Keys

General keys to fine tuning a shape:

outer sep
Text outer separation, initial value: 1.5pt
Inner sep
Text inner separation, initial value: 1pt

thickness (relative to the drawing thickness), initial value: 2

tip len (current source). initial value: 4pt

tip type possible values: triangle and bezier. initial value: triangle minussign len Minus sign len (voltage source). initial value: \pgf@circ@Rlen/14 plussign len (voltage source). initial value: 1.1\pgf@circ@Rlen/14

source radius The base radius. initial value: 0.3\pgf@circ@Rlen

round sources Sources will be round ones

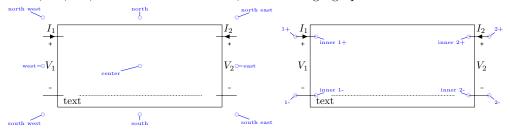

control sources Sources will be control/diamond ones generic, european Impedances will be generic rectangles zigzag, american Impedances will be draw as zigzags

3 Z, Y, G, H Quadripoles

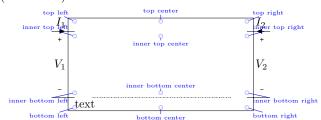

A set of configurable Quadripoles is defined, whereas quadripoles parameters (for instance Z_{11} , Z_{12} , Z_{21} and Z_{22}) are $\langle \text{key-value} \rangle$ parameters.

3.1 The Base Quadripole Shape

The base shape just draws a base box and sets some connection anchors: 1+, 1-, $inner\ 1+$, $inner\ 1-$, 2+, 2-, $inner\ 2+$ and $inner\ 2-$, besides the geographic ones:

And also a set of (meant for) text anchors:

3.1.1 Base Keys

These applies to all Quad shapes:

base width The 'box' width

half base width Ditto, half width. Initial value:2\pgf@circ@Rlen.

base height The distance between 1+ and 1-. The 'box' full height is equal to 2*(half

base height + height ext + height ext +).

half base height Ditto, half height. Initial value:\pgf@circ@Rlen/7

height ext Initial value:2\pgf@circ@Rlen/7

height ext+ Initial value:0

inner ext distance between the 'box' and inner1+/1-/2+/2-. initial value:

\pgf@circ@Rlen/7

outer ext distance between the 'box' and 1+/1-/2+/2-. initial value: 5\pgf@circ@Rlen/14

inner marks If set, the inner anchors will be marked.

outer marks If set, the outer anchors will be marked.

invert The shape will be inverted, more or less like 'x scale=-1'.

alt, opt Case a Voltage source is zero, a series impedance will be draw vertically.

outer x fit to For any Quad, this is the same as outer x fit to*.

```
outer x fit to*
                                 outer x fit*=\{\langle CoordA \rangle\} \{\langle CoordB \rangle\}. The width will be set so that \langle 1+ \rangle and
                                 \langle 2+ \rangle (or \langle 1- \rangle and \langle 2- \rangle, depending on the used anchor) will fit \langle CoordA \rangle and
                                 (CoordB). This might result in a shape rotation.
        outer x fit to!
                                 outer x fit!=\{\langle CoordA \rangle\} \{\langle CoordB \rangle\}. The width will be set so that the dis-
                                 tance between \langle 1+\rangle and \langle 2+\rangle (or \langle 1-\rangle and \langle 2-\rangle, depending on the used anchor)
                                 will be the same as (CoordA) and (CoordB). This will never result in a shape
                                 rotation. For any Quad, this is the same as inner x fit to*.
        inner x fit to
        inner x fit to*
                                 inner x fit*=\{\langle CoordA \rangle\} \{\langle CoordB \rangle\}. The width will be set so that \langle inner 1+ \rangle
                                 and (inner 2+) (or (inner 1-) and (inner 2-), depending on the used anchor)
                                 will fit (CoordA) and (CoordB). This might result in a shape rotation.
        inner x fit to!
                                 inner x fit!=\{\langle CoordA \rangle\} \{\langle CoordB \rangle\}. The width will be set so that the dis-
                                 tance between (inner 1+) and (inner 2+) (or (inner 1-) and (inner 2-), de-
                                 pending on the used anchor) will be the same as (CoordA) and (CoordB). This
                                 will never result in a shape rotation.
        v fit to
                                 For any Quad, this is the same as y fit to!.
        y fit to*
                                 y fit*=\{\langle CoordA \rangle\} \{\langle CoordB \rangle\}. The height will be set so that 1+ and 1- will
                                 fit CoordA and CoordB. This might result in a shape rotation
        v fit to!
                                 y \text{ fit!=}\{\langle CoordA \rangle\}\{\langle CoordB \rangle\}. The height will be set so that the distance
                                 between \langle 1+ \rangle and \langle 1- \rangle will be equal to the distance between \langle CoordA \rangle and
                                 (CoordB). This will never result in a shape rotation.
        label top left
                                 It will place a label at the top left anchor
        label top center
                                 It will place a label at the top center anchor
        label top right
                                It will place a label at the top right anchor
      label inner top left It will place a label at the inner top left anchor
   label inner top center It will place a label at the inner top center anchor
    label inner top right It will place a label at the inner top right anchor
        label bottom left
                                It will place a label at the bottom left anchor
       label bottom center It will place a label at the bottom center anchor
        label bottom right It will place a label at the bottom right anchor
  label inner bottom left It will place a label at the inner bottom left anchor
label inner bottom center It will place a label at the inner bottom center anchor
 label inner bottom right It will place a label at the inner bottom right anchor
```

A small example of the fit to keys:

```
begin{tikzpicture}
draw (0,0) \pincoord(A,blue,225) ++(4,0) \pincoord(B,blue,-45) ++(2,2) \pincoord(C);

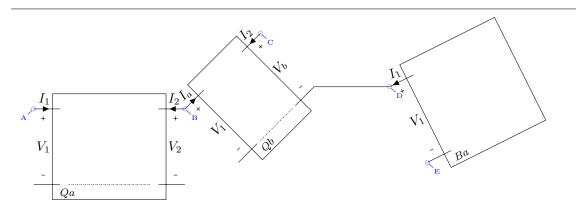

draw (A) node[Quad,anchor=1+,outer x fit to={A}{B}](Qa){\footnotesize$Qa$};

draw (B) node[Quad,anchor=1+,outer x fit to={B}{C},I1=$I_a$,V2=$V_b$](Qb){\footnotesize$Qb$};

draw (Qb.2-) -- ++(2,0) \pincoord(D) ++(1,-2) \pincoord(E);

draw (D) node[Black Box,anchor=1+,y fit to={D}{E}](Ba){\footnotesize$Ba$};

draw (Qa.1-) ++(0,-1);
end{tikzpicture}
```

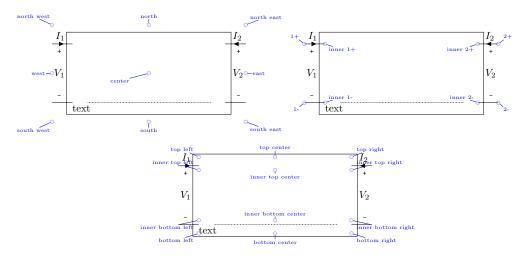

3.2 Quad

```
1 % Node use
2 node[Quad]{}
4 % To path use
5 (A) to[ToQuad] (B)
```

This is just the base shape, to be used in cases whereas one just want to emphasises part of a circuit (using, for instance, the *inner x fit to* key, or just mark a two port black box.

Note: There is also a ToQuad to be used in a to[] path, in which case the key outer x fit to style will be triggered with the starting and ending points of the to[] path.

3.2.1 Quad Keys

```
name (node-name), when using a to[] path.

Initial value:$I_1$

Initial value:$I_2$

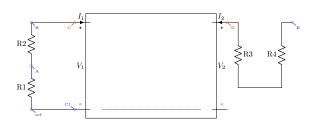

V1 Initial value:$V_1$

V2 Initial value:$V_2$
```

3.2.2 Examples of fit to use

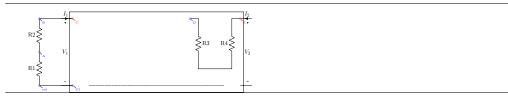

Squeezing a Quadripole between two parts of a circuit (nodes C and D):

```
1 \begin{center}
2 \resizebox{0.5\textwidth}{!}{
3 \begin{tixzpicture}
4 \draw (0,0) \pincoord(ref) to[R=R1] ++(0,2) \pincoord(A) to[R=R2] ++(0,2) \pincoord(B)
5 -- ++(2,0) \pincoord(C,red,225) (C |- ref) \pincoord(C1,blue,135) -- (ref);
6 \draw (C) ++(7,0) \pincoord(D,red) -- ++(0.5,0) to[R=R3] ++(0,-3) -- ++(2,0) to[R=R4] ++(0,3) -- ++(0.5,0) \pincoord(E);
7 \draw (C) node[Quad,anchor=1+,y fit to={C}{C1},outer x fit to={C}{D}]{};
8 \end{tikzpicture}
9 }
10 \end{center}
```

Fitting some circuit inside the Quadripole (nodes C and E):

```
1 \resizebox{0.4\textwidth}{!}{
2 \begin{tikzpicture}
3 \draw (0,0) \pincoord(ref) to [R=R1] ++(0,2) \pincoord(A) to [R=R2] ++(0,2) \pincoord(B)
4 --++(2,0) \pincoord(C,red) (C |- ref) \pincoord(C1) -- (ref);
5 \draw (C) ++(7,0) \pincoord(D) -- ++(0.5,0) to [R=R3] ++(0,-3) -- ++(2,0) to [R=R4] ++(0,3) -- ++(0.5,0) \pincoord(E,red);
6 \draw (C) node[Quad,anchor=inner 1+,y fit to={C}{C1},inner x fit to={C}{E}]{};
7 \end{tikzpicture}
```

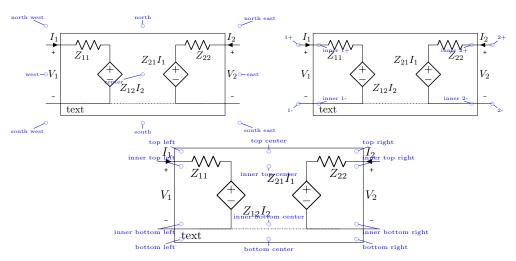

3.3 Quad Z

```
1 % Node use
2 node[Quad Z]{}

% To path use
5 (A) to[ToQuad Z] (B)
```

Besides the base anchors (see 3) it has 4 internal nodes: <node>-Z11, <node>-Z12, <node>-Z21 and <node>-Z22 and each of those sub-nodes has geographic anchors as defined at 2.1.

Note: There is also a ToQuad Z to be used in a to[] path, in which case the key outer x fit to style will be triggered with the starting and ending points of the to[] path.

3.3.1 Quad Z keys

```
name
                      \langle \text{node-name} \rangle, when using a to [] path.
T1
                     Initial value:$I_1$
I2
                     Initial value:$1_2$
V1
                     Initial value:$V_1$
V2
                     Initial value:$V_2$
raw sources
                      This will suppress the control variables (I1, I2) in the sources' labels
Z11
                     Initial value:Z_{11}
Z12
                     Initial value:Z_{12}
Z21
                     Initial value:$Z_{21}$
Z22
                     Initial value:Z_{22}
Z11 label pos
                     changes the label position. Defaults to: {south west}{top left}
Z12 label pos
                     changes the label position. Defaults to: {south east}{top left}
Z21 label pos
                     changes the label position. Defaults to: {north west}{bottom right}
```

Z22 label pos

changes the label position. Defaults to: {south east}{top right}

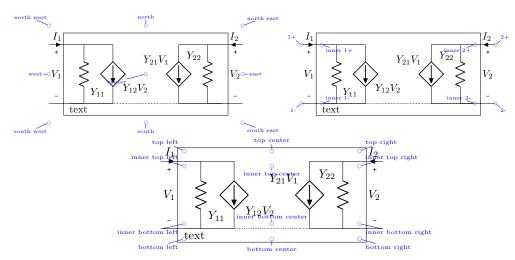

Note: The label pos keys expects two anchor names (... label pos= $\{\langle anchor \ A \rangle\}$ $\{\langle anchor \ B \rangle\}$). The first anchors refers the sub-shape node and the second anchor is the text one.

3.4 Quad Y

```
1 % Node use
2 node[Quad Y]{}
3
4 % To path use
5 (A) to[ToQuad Y] (B)
```

Besides the base anchors (see 3) it has 4 internal nodes: <node>-Y11, <node>-Y12, <node>-Y21 and <node>-Y22 and each of those sub-nodes has geographic anchors as defined at 2.1.

Note: There is also a ToQuad Y to be used in a to[] path, in which case the key outer x fit to style will be triggered with the starting and ending points of the to[] path.

3.4.1 Quad Y keys

```
name
                      \langle \text{node-name} \rangle, when using a to [] path.
I1
                     Initial value:$I_1$
I2
                     Initial value:$1_2$
V1
                     Initial value:$V_1$
V2
                     Initial value:$V_2$
raw sources
                     This will suppress the control variables (V1, V2) in the sources' labels
Y11
                     Initial value: Y_{11}
Y12
                     Initial value:Y_{12}
Y21
                     Initial value:\Y_{21}\$
Y22
                     Initial value:\Y_{22}\$
Y11 label pos
                     changes the label position. Defaults to: {south west}{top left}
Y12 label pos
                     changes the label position. Defaults to: {south east}{top left}
Y21 label pos
                     changes the label position. Defaults to: {north west}{bottom right}
Y22 label pos
                      changes the label position. Defaults to: {north west}{bottom right}
```

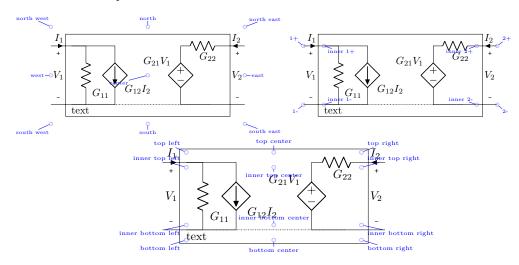

Note: The label pos keys expects two anchor names (... label pos= $\{\langle anchor\ A \rangle\}$ $\{\langle anchor\ B \rangle\}$). The first anchors refers the sub-shape node and the second anchor is the text one.

3.5 Quad G

```
1  % Node use
2  node[Quad G]{}
3
4  % To path use
5  (A) to[ToQuad G] (B)
```

Besides the base anchors (see 3) it has 4 internal nodes: <node>-G11, <node>-G12, <node>-G21 and <node>-G22 and each of those sub-nodes has geographic anchors as defined at 2.1.

Note: There is also a ToQuad G to be used in a to[] path, in which case the key outer x fit to style will be triggered with the starting and ending points of the to[] path.

3.5.1 Quad G keys

```
name
                      \langle \text{node-name} \rangle, when using a to [] path.
T1
                     Initial value:$I_1$
I2
                     Initial value:$1_2$
V1
                     Initial value:$V_1$
V2
                     Initial value:$V_2$
raw
    sources
                     This will suppress the control variables (V1, I2) in the sources' labels
G11
                     Initial value:G_{11}
G12
                     Initial value:G_{12}
G21
                     Initial value:G_{21}
G22
                     Initial value:G_{22}
G11 label pos
                     changes the label position. Defaults to: {south west}{top left}
G12 label pos
                     changes the label position. Defaults to: {south east}{top left}
G21 label pos
                     changes the label position. Defaults to: {north west}{bottom right}
G22 label pos
                     changes the label position. Defaults to: {south east}{top right}
```

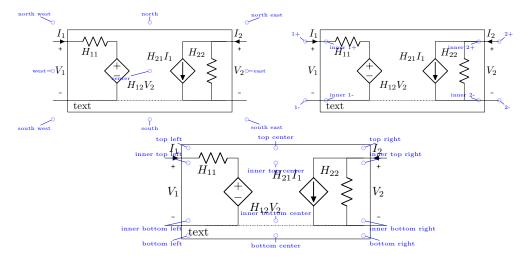

Note: The label pos keys expects two anchor names (... label pos= $\{\langle anchor\ A \rangle\}$ $\{\langle anchor\ B \rangle\}$). The first anchors refers the sub-shape node and the second anchor is the text one.

3.6 Quad H

```
1 % Node use
2 node[Quad H]{}
3
4 % To path use
5 (A) to[ToQuad H] (B)
```

Besides the base anchors (see 3) it has 4 internal nodes: <node>-H11, <node>-H12, <node>-H21 and <node>-H22 and each of those sub-nodes has geographic anchors as defined at 2.1.

Note: There is also a ToQuad H to be used in a to[] path, in which case the key outer x fit to style will be triggered with the starting and ending points of the to[] path.

3.6.1 Quad H keys

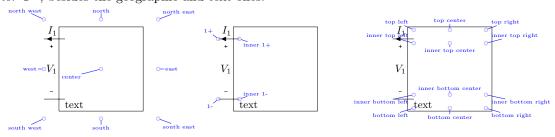

```
name
                      \langle \text{node-name} \rangle, when using a to [] path.
I1
                      Initial value:$I_1$
I2
                      Initial value:I_2
V1
                      Initial value:$V_1$
V2
                      Initial value:$V_2$
raw sources
                      This will suppress the control variables (I1, V2) in the sources' labels
H11
                      Initial value:$H_{11}$
H12
                      Initial value:$H_{12}$
H21
                      Initial value:$H_{21}$
H22
                      Initial value:$H_{22}$
H11 label pos
                      changes the label position. Defaults to: {south west}{top left}
H12 label pos
                      changes the label position. Defaults to: {south east}{top left}
H21 label pos
                      changes the label position. Defaults to: {north west}{bottom right}
H22 label pos
                      changes the label position. Defaults to: {north west}{bottom right}
```

Note: The label pos keys expects two anchor names (... label pos= $\{\langle anchor\ A \rangle\}$ $\{\langle anchor\ B \rangle\}$). The first anchors refers the sub-shape node and the second anchor is the text one.

4 Thevenin, Norton single port boxes

4.1 The Base Black Box Shape

The base shape just draws a base box and sets some connection anchors: 1+, 1-, $inner\ 1+$, $inner\ 1-$, besides the geographic and text ones:

4.1.1 Base Keys

These applies to all *Black Box* shapes:

base width
half base width
base height

The 'box' width
Ditto, half width. Initial value:2\pgf@circ@Rlen.

The distance between 1+ and 1-. The 'box' full height is equal to 2*(half base height + height ext + height ext+).

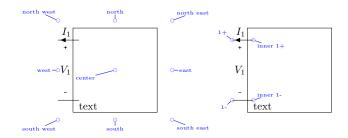

```
half base height
                                                  Ditto, half height. Initial value:\pgf@circ@Rlen/7
             height ext
                                                  Initial value:2\pgf@circ@Rlen/7
             height ext+
                                                  Initial value:0
             inner ext
                                                  distance between the 'box'
                                                                                                                                                                  initial value:
                                                                                                            and inner1+/1-/2+/2-.

 label inner bottom right It will place a label at the inner bottom right anchor
```

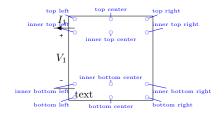

4.2 Black Box

```
1 % Node use
2 node[Black Box]{}
3
4 % To path use
5 (A) to[ToBlack Box] (B)
```

This is just the base shape, to be used in cases whereas one just want to emphasises part of a circuit (using, for instance, the *inner x fit to* key, or just mark a single port black box.

Note: There is also a ToBlack Box to be used in a to[] path, in which case the key y fit to style will be triggered with the starting and ending points of the to[] path.

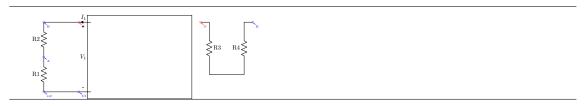

4.2.1 Black Box keys

name	$\langle \text{node-name} \rangle$, when using a to [] path.
I1	Initial value:\$I_1\$
V1	Initial value:\$V_1\$

4.2.2 Examples of fit to use

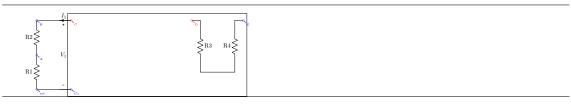

Squeezing a Black Box between two parts of a circuit (nodes C and D):

```
1 \resizebox{0.4\textwidth}{!}{
2 \begin{tikzpicture}
3  \draw (0,0) \pincoord(ref) to[R=R1] ++(0,2) \pincoord(A) to[R=R2] ++(0,2) \pincoord(B)
4  -- ++(2,0) \pincoord(C,red) (C |- ref) \pincoord(C1) -- (ref);
5  \draw (C) ++(7,0) \pincoord(D,red) -- ++(0.5,0) to[R=R3] ++(0,-3) -- ++(2,0) to[R=R4] ++(0,3) -- ++(0.5,0) \pincoord(E);
6  \draw (C) node[Black Box,anchor=1+,y fit to={C}{C1},outer x fit to={C}{D}]{};
7 \end{tikzpicture}
8 }
```

Fitting some circuit inside the Black Box (nodes C and E):

```
1 \resizebox{0.4\textwidth}{!}{
2 \begin{tikzpicture}
3 \draw(0,0) \pincoord(ref) to[R=R1] ++(0,2) \pincoord(A) to[R=R2] ++(0,2) \pincoord(B)
4 --++(2,0) \pincoord(C,red) (C |- ref) \pincoord(C1) -- (ref);
5 \draw(C) ++(7,0) \pincoord(D,red) -- ++(0.5,0) to[R=R3] ++(0,-3) -- ++(2,0) to[R=R4] ++(0,3) -- ++(0.5,0) \pincoord(E);
6 \draw(C) node[Black Box,anchor=inner 1+,y fit to={C}{C1},inner x fit to={C}{E}]{};
7 \end{tikzpicture}
8 }
```

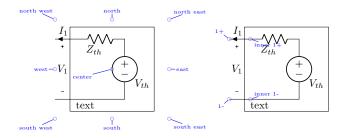

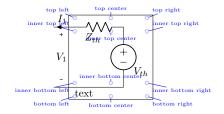

4.3 Thevenin

```
1 % Node use
2 node[Thevenin] {}
3
4 % To path use
5 (A) to[ToThevenin] (B)
```

This is the classical Thevenin circuit. Besides the base anchors (see 4.1) it has 2 internal nodes: <node>-Zth and <node>-Vth and each of those sub-nodes has geographic anchors as defined at 2.1.

Note: There is also a *ToThevenin* to be used in a *to[]* path, in which case the key y fit to style will be triggered with the starting and ending points of the *to[]* path.

4.3.1 Thevenin keys

```
name \( \text{node-name} \), when using a to[] path.

Initial value:\[ \frac{1}{2} \]

V1 Initial value:\[ \frac{1}{2} \]

Zth Initial value:\[ \frac{1}{2} \]

Vth Iabel pos changes the label position. Defaults to: \{ \text{south west} \} \{ \text{top left} \}

Vth Iabel pos changes the label position. Defaults to: \{ \text{south east} \} \{ \text{top left} \}

Vth Iabel pos changes the label position. Defaults to: \{ \text{south east} \} \{ \text{top left} \}
```

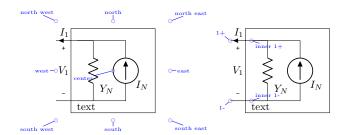

Note: The label pos keys expects two anchor names (... label pos= $\{\langle anchor \ A \rangle\}$). The first anchors refers the sub-shape node and the second anchor is the text one.

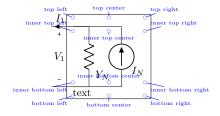

4.4 Norton

```
1 % Node use
2 node[Norton] {}
3
4 % To path use
5 (A) to[ToNorton] (B)
```

This is the classical Norton circuit. Besides the base anchors (see 4.1) it has 2 internal nodes: <node>-Yn and <node>-In and each of those sub-nodes has geographic anchors as defined at 2.1.

Note: There is also a ToNorton to be used in a to[] path, in which case the key y fit to style will be triggered with the starting and ending points of the to[] path.

4.4.1 Norton keys

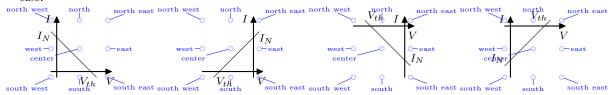

Note: The label pos keys expects two anchor names (... label pos= $\{\langle anchor \ A \rangle\}$ $\{\langle anchor \ B \rangle\}$). The first anchors refers the sub-shape node and the second anchor is the text one.

5 Pseudo-Graph Shape

```
1 % Node use
2 node[PG load line]{}
4 node[PG linear load line]
```

Sometimes when representing a single port sub-circuit, one might use a X-Y graph, for which <code>gnuplot</code> and <code>pgfplots</code> are excellent choices, but a bit overkill if all you want is a crude representation of a linear load line.

This shape is just that, a X-Y graph mockup, that nicely fits inside a black box, and nothing else.

5.1 Pseudo-Graph Keys

These are the keys to fine tuning a shape:

x axis X axis name. Initial value: Vx val X axis val at the crossing point. Initial value: V_{th} y axis Y axis name. Initial value: Iv val Y axis val at the crossing point. Initial value: I_N first quadrant First quadrant mock up. (which is also the default). second quadrant Second quadrant mock up. third quadrant Third quadrant mock up. fourth quadrant Fourth quadrant mock up. base width The *graph* width half base width Ditto, half width. Initial value:0.5\pgf@circ@Rlen. base height The *graph* height

Note: Besides these, one can also use the keys presented at 2.2.

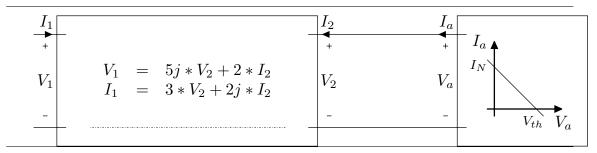

Ditto, half height. Initial value:0.5\pgf@circ@Rlen.

6 Examples of use

half base height

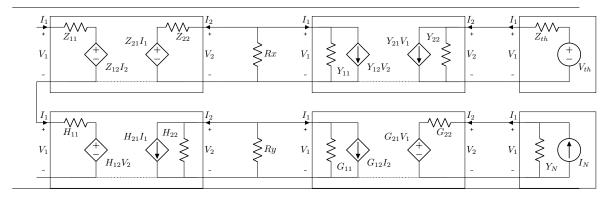

First of, a simple case of combining a generic Quad with equations and a generic Black Box with a Pseudo-Graph:

```
1 \resizebox{\textwidth}{!}{
2 \begin{tikzpicture}
3 \draw (0,0) \ncoord(ref) node[Quad,anchor=1+](Q1){}
4 (Q1.2+) -- ++(1,0) \ncoord(X) -- ++(1,0) node[Black Box,anchor=1+,V1=$V_a$,I1=$I_a$](B1){}
5 (Q1.2-) -- (B1.1-)
6 (B1.center) node[PG linear load line,x axis=$V_a$,y axis=$I_a$]{}
7 (Q1.center) node{$ \begin{matrix}}
8 V_1 &=& 5j*V_2 + 2*I_2 \\
9 I_1 &=& 3*V_2 + 2j*I_2
10 \end{matrix} $%
1 };
12 \end{tikzpicture}
13 }
```

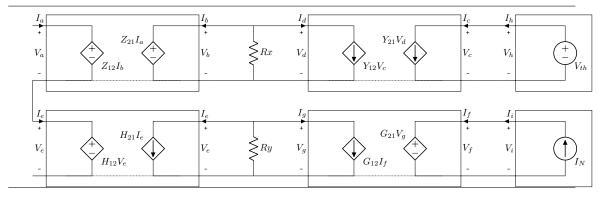

All default Quadripoles and Thevenin/Norton.

```
1 \resizebox{\textwidth}{!}{
2 \begin{tikzpicture}
3   \draw (0,0) \ncoord(ref) node[Quad Z,anchor=1+] (Qz1){}
4   (Qz1.2+) -- ++(1.5,0) \ncoord(X) -- ++(1.5,0) node[Quad Y,anchor=1+] (Qy1){}
5   (Qy1.2+) -- ++(1,0) node[Thevenin,anchor=1+] (th1){}
6   (Qz1.1-) -- ++(0,-1.5) node[Quad H,anchor=1+] (Qh1){}
7   (Qh1.2+) -- ++(1.5,0) \ncoord(Y) -- ++(1.5,0) node[Quad G,anchor=1+] (Qg1){}
8   (Qg1.2+) -- ++(1,0) node[Norton,anchor=1+] (nr1){}
9   (Qz1.2-) -- (Qy1.1-) (Qy1.2-) -- (th1.1-)
10   (Qh1.2-) -- (Qg1.1-) (Qg1.2-) -- (nr1.1-)
11   ;
12   \draw (X) to[R=$Rx$] (X |- Qz1.2-)
13   (Y) to[R=$Ry$] (Y |- Qh1.2-)
14   ;
15 \end{tikzpicture}
16 }
```

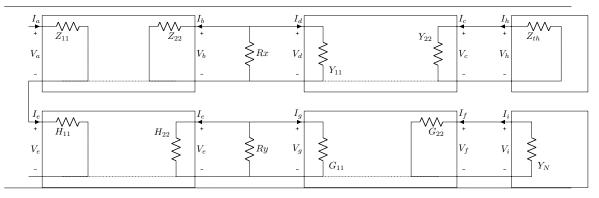

The same demo but with all parameter 11 and 22 zeroed, and changing the "control sources"

```
1 \resizebox{\textwidth}{!}{
2 \textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\textbf{\t
```

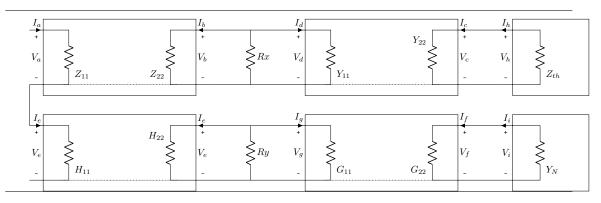

Now with the 12 and 21 parameters zeroed, normal form:

```
1 \resizebox{\textwidth}{!}{
2 \begin{tikzpicture}
3 \draw (0,0) \ncoord(ref) node[Quad Z,anchor=1+,Z12=0,Z21=0,I1=$I_a$,V1=$V_a$,I2=$I_b$,V2=$V_b$](Qz1){}
4 (Qz1.2+) -- ++(1.5,0) \ncoord(X) -- ++(1.5,0) node[Quad Y,anchor=1+,Y12=0,Y21=0,I1=$I_d$,V1=$V_d$,I2=$I_c$,V
2=$V_c$](Qy1){}
5 (Qy1.2+) -- ++(1,0) node[Thevenin,anchor=1+,Vth=0,I1=$I_h$,V1=$V_h$](th1){}
6 (Qz1.1-) -- ++(0,-1.5) node[Quad H,anchor=1+,H12=0,H21=0,I1=$I_e$,V1=$V_e$,I2=$I_e$,V2=$V_e$](Qh1){}
7 (Qh1.2+) -- ++(1.5,0) \ncoord(Y) -- ++(1.5,0) node[Quad G,anchor=1+,G12=0,G21=0,I1=$I_g$,V1=$V_g$,I2=$I_f$,V
2=$V_f$](Qg1){}
8 (Qg1.2+) -- ++(1,0) node[Norton,anchor=1+,In=0,I1=$I_i$,V1=$V_i$](nr1){}
9 (Qz1.2-) -- (Qy1.1-) (Qy1.2-) -- (th1.1-)
10 (Qh1.2-) -- (Qg1.1-) (Qg1.2-) -- (nr1.1-)
11 ;
12 \draw (X) to[R=$Rx$] (X |- Qz1.2-)
13 (Y) to[R=$Ry$] (Y |- Qh1.2-)
14 ;
15 \end{tikzpicture}
16 }
```

Same as last one, but with an alternate form:

Setting all parameters, some impedances as zig-zag, others as generic, per quadripole:

```
\resizebox{\textwidth}{!}{
    1
               \begin{tikzpicture}
   2
                         \draw (0,0) \ncoord(ref) node[Quad Z,alt,round sources,european,anchor=1+,Z11=$Z_a$,Z22=$Z_b$,Z12=$Z_{re}},Z21=$
                                  Z_{fe}$,I1=$I_a$,V1=$V_a$,I2=$I_b$,V2=$V_b$](Qz1){}
(Qz1.2+) -- ++(1.5,0) \ncoord(X) -- ++(1.5,0) \node[Quad Y,alt,anchor=1+,Y11=$Y_a$,Y22=$Y_b$,Y12=$Y_{re}},Y21=$
Y_{fe}$,I1=$I_d$,V1=$V_d$,I2=$I_c$,V2=$V_c$](Qy1){}
                                  (Qy1.2+) -- ++(1,0) node[Thevenin,alt,anchor=1+,Vth=$V_1$,Zth=$Z_a$,I1=$I_h$,V1=$V_h$](th1){}
(Qz1.1-) -- ++(0,-1.5) node[Quad H,european,alt,anchor=1+,H11=$H_a$,H22=$H_b$,H12=$H_{re}},H21=$H_{fe}},I1=$I_
    6
