# The I3pdfmeta module PDF standards IATEX PDF management testphase bundle

The LATEX Project\*

Version 0.96d, released 2023-12-09

# 1 **I3pdfmeta** documentation

This module sets up some tools and commands needed for PDF standards in general. The goal is to collect the requirements and to provide code to check and fulfill them.

# 1.1 Verifying requirements of PDF standards

Standards like pdf/A set requirements on a PDF: Some things have be in the PDF, e.g. the catalog has to contain a /Lang entry and an colorprofile and an /OutputIntent, some other things are forbidden or restricted, e.g. the action dictionary of an annotation should not contain Javascript.

The l3pdfmeta module collects a number of relevant requirements, tries to enforce the ones which can be enforced and offers some tools for package authors to test if an action is allowed in the standard or not.

This is work in progress and more tests will be added. But it should be noted that it will probably never be possible to prevent all forbidden actions or enforce all required ones or even to simply check all of them. The commands here don't replace a check with an external validator.

Verifying against a PDF-standard involves two different task:

- Check if you are allowed to ignore the requirement.
- Decide which action to take if the answer to the first question is NO.

The following conditionals address the first task. Because of the second task a return value FALSE means that the standard requires you to do some special action. TRUE means that you can ignore this requirement. $^1$ 

In most cases it only matters if a requirement is in the standard, for example Catalog\_no\_OCProperties means "don't use /OCProperties in the catalog". For a small number of requirements it is also needed to test a user value against a standard value. For example, named\_actions restricts the allowed named actions in an annotation

<sup>\*</sup>E-mail: latex-team@latex-project.org

<sup>&</sup>lt;sup>1</sup>One could also make the logic the other way round—there are arguments for both—but I had to decide.

of subtype /Named, in this case it is needed to check not only if the requirement is in the standard but also if the user value is in the allowed list.

```
\verb|\pdfmeta_standard_verify_p:n * \pdfmeta_standard_verify:n{\langle requirement \rangle}|
\pdfmeta_standard_verify:nTF *
```

This checks if  $\langle requirement \rangle$  is listed in the standard. FALSE as result means that the requirement is in the standard and that probably some special action is requiredwhich one depends on the requirement, see the descriptions below. TRUE means that the requirement is not there and so no special action is needed. This check can be used for simple requirements where neither a user nor a standard value is of importance.

This checks if (requirement) is listed in the standard, if yes it tries to find a predefined test handler for the requirement and passes  $\langle value \rangle$  and the value recorded in the standard to it. The handler returns FALSE if some special action is needed (e.g. if  $\langle value \rangle$  violates the rule) and TRUE if no special action is needed. If no handler exists this commands works like \pdfmeta\_standard\_verify:n.

In some cases one needs to query the value in the standard, e.g. to correct a wrong minimal PDF version you need to know which version is required by min\_pdf\_version. For this two commands to access the value are provided:

\pdfmeta\_standard\_item:n \* \pdfmeta\_standard\_item:n{\langle requirement \rangle}

This retrieves the value of  $\langle requirement \rangle$  and leaves it in the input. If the requirement isn't in the standard the result is empty, that means that requirements not in the standard and requirement without values can not be distinguished here.

This retrieves the value of  $\langle requirement \rangle$  and stores it in the  $\langle token\ list\ variable \rangle$ . If the  $\langle requirement \rangle$  is not found the special value  $\neq no\_value$  is used. The  $\langle token\ list$ variable is assigned locally.

The following describe the requirements which can be currently tested. Requirements with a value should use \pdfmeta\_standard\_verify:nn or \pdfmeta\_standard\_verify:nnN to test a local value against the standard. The rule numbers refer to https://docs.verapdf.org/validation/pdfa-part1/

#### 1.1.1Simple tests without handler

outputintent\_A requires to embed a color profile and reference it in a /Outputintent and that all output intents reference the same colorprofile. The value stores the subtype. This requirement is detected and fulfilled by l3pdfmeta if the provided interface in \DocumentMetadata is used, see below.

annot flags in annotations the Print flag should be true, Hidden, Invisible, NoView should be false. This requirement is detected and set by I3pdfmeta for annotations created with the l3pdfannot. A new check is only needed if the flags are changed or if links are created by other means.

no\_encryption don't encrypt

- no\_external\_content no /F, /FFilter, or /FDecodeParms in stream dictionaries
- no\_embed\_content no /EF key in filespec, no /Type/EmbeddedFiles. This will be checked in future by l3pdffiles for the files it embeds. The restrictment is set for only PDF/A-1b. PDF/A-2b and PDF/A3-b lifted this restriction: PDF/A-2b allows to embed other PDF documents conforming to either PDF/A-1 or PDF/A-2, and PDF/A-3 allows any embedded files. I don't see a way to test the PDF/A-2b requirement so currently it will simply allow everything. Perhaps a test for at least the PDF-format will be added in future.
- Catalog\_no\_OCProperties don't add /OCProperties to the catalog l3pdfmeta removes this entry at the end of the document
- annot\_widget\_no\_AA (rule 6.6.2-1) no AA dictionary in widget annotation, this will e.g. be checked by the new hyperref driver.
- annot\_widget\_no\_A\_AA (rule 6.9-2) no A and AA dictionary in widget.
- form\_no\_AA (6.9-3) no /AA dictionary in form field
- unicode that is set in the U-standards, A-2u and A-3u and means that every text should be in unicode. This is not something that can be enforced or tested from TeX, but in a current LaTeX normally ToUnicode are set for all fonts.
- tagged that is set in A-2a and A-3a and means that the pdf must be tagged. This is currently neither tested not enforced somewhere.
- no\_CharSet CharSet is deprecated is pdf 2.0 and should not be used in A-4. l3pdfmeta will therefore suppress it for the engines pdftex and luatex (the other engines have no suitable option)
- Trailer\_no\_Info The Info dictionary has been deprecated since quite some time. Metadata should be set with XMP-data instead. In PDF A-4 now the Info dictionary shall not be present in the trailer dictionary at all (unless there exists a PieceInfo entry in the Catalog). And if it is present it should only contain the /ModDate entry. In texlive 2023 the engines pdftex and luatex have primitives to suppress the dictionary and l3pdfmeta will make use of it.

#### 1.1.2 Tests with values and special handlers

- min\_pdf\_version stores the minimal PDF version needed for a standard. It should be checked against the current PDF version (\pdf\_version:). A failure means that the version should be changed. Currently there is only one hard requirement which leads to a failure in a validator like verapdf: The A-4 standard should use PDF 2.0. As PDF A-1 is based on PDF 1.4 and PDF A-2 and A-3 are based on PDF 1.7 l3pdfmeta also sets these versions also as requirements. These requirements are checked by l3pdfmeta when the version is set with \DocumentMetadata and a warning is issued (but the version is not changed). More checks are only needed if the version is changed later.
- max\_pdf\_version stores the maximal PDF version. It should be checked against the current PDF version (\pdf\_version:). A failure means that the version should be changed. The check is currently relevant only for the A-1 to A-3 standards: PDF

2.0 leads to a failure in a validator like verapdf so the maximal version should be PDF 1.7. This requirement is checked by l3pdfmeta when the version is set with \DocumentMetadata and a warning is issued (but the version is not changed). More checks are only needed if the version is changed later.

named\_actions this requirement restricts the list of allowed named actions to NextPage, PrevPage, FirstPage, LastPage. The check should supply the named action without slash (e.g. View (failure) or NextPage (pass)).

annot\_action\_A (rule 6.6.1-1) this requirement restricts the allowed subtypes of the /A dictionary of an action. The check should supply the user subtype without slash e.g. as GoTo (pass) or Movie (failure).

# 1.2 Colorprofiles and OutputIntent

The pdf/A standards require that a color profile is embedded and referenced in the catalog in the /OutputIntent array.

The problem is that the pdf/A standards also require, that if the PDF has more then one entry in the /OutputIntent array (which is allowed), their /DestOutputProfile should all reference the same color profile<sup>2</sup>.

Enforcing this fully is impossible if entries are added manually by users or packages with  $\pdfmanagement\_add:nnn_{\colored}{OutputIntents}{\langle object\ reference\rangle}$  as it is difficult to inspect and remove entries from the  $\coloreddef{OutputIntent}$  array.

So we provide a dedicated interface to avoid the need of manual user settings and allow the code to handle the requirements of the standard. The interface doesn't handle yet all finer points for PDF/X standards, e.g. named profiles, it is meant as a starting point to get at least PDF/A validation here.

The interface looks like this

```
\DocumentMetadata
{
    %other options for example pdfstandard
    colorprofiles=
    {
        A = sRGB.icc, %or a or longer GTS_PDFA1 = sRGB.icc
        X = FOGRA39L_coated.icc, % or x or longer GTS_PDFX
        ISO_PDFE1 = whatever.icc
    }
}
```

sRGB.icc and FOGRA39L\_coated.icc (from the colorprofiles package are predefined and will work directly<sup>3</sup>. whatever.icc will need special setup in the document preamble to declare the values for the OutputIntent dictionary, but the interface hasn't be added yet. This will be decided later.

If an A-standard is detected or set which requires that all /DestOutputProfile reference the same color profile, the setting is changed to the equivalent of

<sup>&</sup>lt;sup>2</sup>see rule 6.2.2-2 at https://docs.verapdf.org/validation/pdfa-part1/

<sup>&</sup>lt;sup>3</sup>The dvips route will require that ps2pdf is called with -dNOSAFER, and that the color profiles are in the current folder as ps2pdf doesn't use kpathsea to find them.

```
\DocumentMetadata
{
    %other options
    pdfstandard=A-2b,
    colorprofiles=
    {
        A = sRGB.icc, %or longer GTS_PDFA1 = sRGB.icc
        X = sRGB.icc,
        ISO_PDFE1 = sRGB.icc
}
```

The pdf/A standards will use A=sRGB.icc by default, so this doesn't need to be declared explicitly.

#### 1.3 Regression tests

When doing regression tests one has to set various metadata to fix values.

\pdfmeta\_set\_regression\_data: \pdfmeta\_set\_regression\_data:

This sets various metadata to values needed by the IATEX regression tests. It also sets the seed for random functions. If a current l3backend is used and \c\_sys\_timestamp\_str is available, the command does not set dates, but assumes that the environment variable SOURCE\_DATE\_EPOCH is used.

# 2 XMP-metadata

XMP-metadata are data in XML format embedded in a stream inside the PDF and referenced from the /Catalog. Such a XMP-metadata stream contains various document related data, is required by various PDF standards and can replace or extend the data in the /Info dictionary. In PDF 2.0 the /Info dictionary is actually deprecated and only XMP-metadata should be used for the metadata of the PDF.

The content of a XMP-metadata stream is not a fix set of data. Typically fields like the title, the author, the language and keywords will be there. But standards like e.g. ZUGferd (a standard for electronic bills) can require to add more fields, and it is also possible to define and add purely local data.

In some workflows (e.g. if dvips + ghostscript is used) a XMP-metadata stream with some standard content is added automatically by the backend, but normally it must be created with code.

For this task the packages hyperxmp, xmpincl or pdfx (which uses xmpincl) can be used, but all these packages are not compatible with the pdfmanagement<sup>4</sup>. The following code is meant as replacement for these packages.

hyperxmp uses \hypersetup as user interface to enter the XMP-metadata. This syntax is also supported by the new code<sup>5</sup>, so if hyperref has been loaded, e.g. pdftitle=xxx

<sup>&</sup>lt;sup>4</sup>hyperxmp was partly compatible as the pdfmanagement contained some patches for it, but these patches have now been removed.

<sup>&</sup>lt;sup>5</sup>with a number of changes which are discussed in more details below

can be used to set the title. But XMP-metadata shouldn't require to use hyperref and in a future version an interface without hyperref will be added.

There is currently no full user interface command to extend the XMP-metadata with for example the code needed for ZUGferd, they will be added in a second step.

#### 2.1 Debug option

The resulting XMP-packet can be written to an external file by activating a debug option

```
\DocumentMetadata{debug={xmp-export}}
%or
\DocumentMetadata{debug={xmp-export=true}}
%or
\DocumentMetadata{debug={xmp-export=filename}}
```

By default the data are written to \jobname.xmpi, if a filename is given, then filename.xmpi is used instead. xmp-export=false deactivates the export.

## 2.2 Encoding and escaping

XMP-metadata are stored as UTF-8 in the PDF. This mean if you open a PDF in an editor a content like "grüße" will be shown probably as "grÃ $^{1}$ 4ße". As XMP-metadata are in XML format special chars like <, >, and & and , must be escaped.

hyperxmp hooks into hyperref and passes all input through \pdfstringdef. This means a word like "hallo" is first converted by \pdfstringdef into \376\377\000h\000a\0001\0000 and then back to UTF-8 by hyperxmp and in the course of this action the XML-escapings are applied. pdfx uses \pdfstringdef together with a special fontencoding (similar to the PU-encoding of hyperref) for a similar aim. The code here is based on \text\_purify:n followed by a few replacements for the escaping.

User data should normally be declared in the preamble (or even in the \DocumentMetadata command), and consist of rather simple text; & can be entered as \& (but directly & will normally work too), babel shorthands should not be used. Some datas are interpreted as comma lists, in this cases commas which are part of the text should be protected by braces. In some cases a text in brackets like [en] is interpreted as language tag, if they are part of a text they should be protected by braces too. XMP-metadata are stored uncompressed in the PDF so if you are unsure if a value has been passed correctly, open the PDF in an editor, copy the whole block and pass it to a validator, e.g. https://www.w3.org/RDF/Validator/.

## 2.3 User interfaces and differences to hyperxmp

#### 2.3.1 PDF standards

The hyperxmp/hyperref keys pdfapart, pdfaconformance, pdfuapart, pdfxstandard and pdfa are ignored by this code. Standards must be set with the pdfstandard key of \DocumentMetadata. This key can be used more than once, e.g.

pdfstandard=A-2b,pdfstandard=X-4,pdfstandard=UA-1.

Note that using these keys doesn't mean that the document actually follows the standard. LaTeX can neither ensure nor check all requirements of a standard, and not everything it can do theoretically has already been implemented. When setting an A standard, the code will e.g. insert a color profile and warn if the PDF version doesn't fit, but X and

UA currently only adds the relevant declarations to the XMP-metadata. It is up to the author to ensure and validate that the document actually follows the standard.

#### 2.3.2 Declarations

PDF knows beside standards also a more generic method to declare conformance to some specification by adding a declaration, see https://pdfa.org/wp-content/uploads/2019/09/PDF-Declarations.pdf). Such declarations can be added as a simple url which identify the specification or with additional details regarding date and credentials. An example would be

```
\DocumentMetadata{}
\documentclass{article}
\ExplSyntaxOn
\pdfmeta xmp add declaration:e {https://pdfa.org/declarations\c hash str iso32005}
\pdfmeta_xmp_add_declaration:ennnn
 {https://pdfa.org/declarations\c_hash_str wcag21A}{}{2023-11-20}{}{}
\pdfmeta_xmp_add_declaration:nnnnn
 {https://github.com/TikZlings/no-duck-harmed}
  {Ulrike~Fischer}{2023-11-20}{Bär}{https://github.com/u-fischer/bearwear}
\pdfmeta_xmp_add_declaration:nnnnn
{https://github.com/TikZlings/no-duck-harmed}
 {Ulrike~Fischer}{2023-11-20}{Paulo}{https://github.com/cereda/sillypage}
\ExplSyntaxOff
\begin{document}
text
\end{document}
```

#### 2.3.3 Dates

• The dates xmp:CreateDate, xmp:ModifyDate, xmp:MetadataDate are normally set automatically to the current date/time when the compilation started. If they should be changed (e.g. for regression tests to produce reproducible documents) they can be set with \hypersetup with the keys pdfcreationdate, pdfmoddate and pdfmetadate.

```
\hypersetup{pdfcreationdate=D:20010101205959-00'00'}
```

The format should be a full date/time in PDF format, so one of these (naturally the numbers can change):

```
D:20010101205959-00'00'
D:20010101205959+00'00'
D:20010101205959Z
```

• The date dc:date is an "author date" and so should normally be set to the same date as given by \date. This can be done with the key pdfdate<sup>6</sup>. The value should be a date in ISO 8601 format:

<sup>&</sup>lt;sup>6</sup>Extracting the value automatically from **\date** is not really possible as authors often put formatting or additional info in this command.

```
2022 %year
2022-09-04 %year-month-day
2022-09-04T19:20 %year-month-day hour:minutes
2022-09-04T19:20:30 % year-month-day hour:minutes:second
2022-09-04T19:20:30.45 % year-month-day hour:minutes:second with fraction
2022-09-04T19:20+01:00 % with time zone designator
2022-09-04T19:20-02:00 % time zone designator
2022-09-04T19:20Z % time zone designator
```

It is also possible to give the date as a full date in PDF format as described above. If not set the current date/time is used.

## 2.4 Language

The code assumes that a default language is always declared (as the pdfmanagement gives the /Lang entry in the catalog a default value) This language can be changed with the \DocumentMetadata key lang (preferred) but the hyperref key pdflang is also honored. Its value should be a simple language tag like de or de-DE.

The main language is also used in a number of attributes in the XMP data, if wanted a different language can be set here with the hyperref/hyperxmp key pdfmetalang.

A number of entries can be given a language tag. Such a language is given by using an "optional argument" before the text:

```
\hypersetup{pdftitle={[en]english,[de]deutsch}}
\hypersetup{pdfsubtitle={[en]subtitle in english}}
```

#### 2.5 Rights

The keys pdfcopyright and pdflicenseurl work similar as in hyperxmp. But differently to hyperxmp the code doesn't set the xmpRights:Marked property, as I have some doubts that one deduce its value simply by checking if the other keys have been used; if needed it should be added manually.

#### 2.6 PDF related data

The PDF producer is for all engines by default built from the engine name and the engine version and doesn't use the banners as with hyperxmp and pdfx, it can be set manually with the pdfproducer key.

The key pdftrapped is ignored. Trapped is deprecated in PDF 2.0.

#### 2.7 Document data

The authors should be given with the **pdfauthor** key, separated by commas. If an author contains a comma, protect/hide it by a brace.

#### 2.8 User commands

The XMP-meta data are added automatically. This can be suppressed with the \DocumentMetadata key xmp.

With this command additional XML code can be added to the Metadata. The content is added unchanged, and not sanitized.

```
\pdfmeta_xmp_xmlns_new:nn \pdfmeta_xmp_xmlns_new:nn{\langle prefix \rangle}{\langle uri \rangle}
```

With this command a xmlns name space can be added.

With the two following commands PDF declarations can be added to the XMP metadata (see https://pdfa.org/wp-content/uploads/2019/09/PDF-Declarations. pdf).

```
\pdfmeta_xmp_add_declaration:n \pdfmeta_xmp_add_declaration:n{\langle uri \rangle}
\pdfmeta_xmp_add_declaration:e
```

This add a PDF declaration with the required conformsTo property to the XMP metadata. (uri) should not be empty and is a URI specifying the standard or profile referred to by the PDF Declaration. If the uri contains a hash, use \c\_hash\_str to excape it and use the e variant to expand it.

```
\pdfmeta_xmp_add_declaration:nnnnn \pdfmeta_xmp_add_-
\verb|\pdfmeta_xmp_add_declaration:ennnn| | \langle uri \rangle | \{\langle By \rangle \} | \{\langle Credentials \rangle \} | \{\langle Credentials \rangle \} | \{\langle Credentials \rangle \} | \langle Credentials \rangle | \{\langle Credentials \rangle \} | \langle Credentials \rangle | \{\langle Credentials \rangle \} | \langle Credentials \rangle | \{\langle Credentials \rangle \} | \langle Credentials \rangle | \langle
```

This add a PDF declaration to the XMP metadata similar to \pdfmeta\_xmp\_add\_declaration:n. With  $\langle By \rangle$ ,  $\langle Date \rangle$ ,  $\langle Credentials \rangle$ ,  $\langle Report \rangle$  the optional fields claimBy (text), claimDate (iso date), claimCredentials (text) and claimReport (uri) of the claimData property can be given. If \pdfmeta\_xmp\_add\_declaration:nnnnn is used twice with the same  $\langle uri \rangle$  argument the claimData are concatenated. There is no check if the claimData are identical.

#### 3 **I3pdfmeta** implementation

```
1 (@@=pdfmeta)
                        2 (*header)
                          \ProvidesExplPackage{13pdfmeta}{2023-12-09}{0.96d}
                            {PDF-Standards---LaTeX PDF management testphase bundle}
                        5 (/header)
                      Message for unknown standards
                        6 (*package)

                      Message for not fitting pdf version
                        8 \msg_new:nnn {pdf }{wrong-pdfversion}
                            {PDF~version~#1~is~too~#2~for~standard~',#3'.}
\l__pdfmeta_tmpa_tl
\l__pdfmeta_tmpb_tl
                        10 \tl_new:N \l__pdfmeta_tmpa_tl
\l__pdfmeta_tmpa_str
                        11 \tl_new:N \l__pdfmeta_tmpb_tl
\g_pdfmetatmpa_str
\l__pdfmeta_tmpa_seq
                                                                9
\l__pdfmeta_tmpb_seq
```

```
12 \str_new:N \l__pdfmeta_tmpa_str
13 \str_new:N \g__pdfmeta_tmpa_str
14 \seq_new:N \l__pdfmeta_tmpa_seq
15 \seq_new:N \l__pdfmeta_tmpb_seq
(End of definition for \l_pdfmeta_tmpa_tl and others.)
```

# 3.1 Standards (work in progress)

#### 3.1.1 Tools and tests

This internal property will contain for now the settings for the document.

\g\_\_pdfmeta\_standard\_prop

```
16 \prop_new:N \g__pdfmeta_standard_prop
(End of definition for \g__pdfmeta_standard_prop.)
```

#### 3.1.2 Functions to check a requirement

At first two commands to get the standard value if needed:

\pdfmeta\_standard\_item:n

```
17 \cs_new:Npn \pdfmeta_standard_item:n #1
18 {
19    \prop_item:Nn \g__pdfmeta_standard_prop {#1}
20 }
(End of definition for \pdfmeta_standard_item:n. This function is documented on page 2.)
```

\pdfmeta\_standard\_get:nN

```
21 \cs_new_protected:Npn \pdfmeta_standard_get:nN #1 #2
22  {
23     \prop_get:NnN \g_pdfmeta_standard_prop {#1} #2
24  }
```

(End of definition for \pdfmeta\_standard\_get:nN. This function is documented on page 2.)

Now two functions to check the requirement. A simple and one value/handler based.

\pdfmeta\_standard\_verify\_p:n
\pdfmeta\_standard\_verify:nTF

This is a simple test is the requirement is in the prop.

(End of definition for \pdfmeta\_standard\_verify:nTF. This function is documented on page 2.)

 $\verb| \pdfmeta_standard_verify:nn] $\underline{TF}$ |$ 

This allows to test against a user value. It calls a test handler if this exists and passes the user and the standard value to it. The test handler should return true or false.

```
\prg_new_protected_conditional:Npnn \pdfmeta_standard_verify:nn #1 #2 {T,F,TF}
      \prop_if_in:NnTF \g__pdfmeta_standard_prop {#1}
37
38
           \cs_if_exist:cTF {__pdfmeta_standard_verify_handler_#1:nn}
39
40
               \exp_args:Nnne
41
               \use:c
42
                 {__pdfmeta_standard_verify_handler_#1:nn}
43
                 { #2 }
                 { \prop_item: Nn \g_pdfmeta_standard_prop {#1} }
             }
             {
               \prg_return_false:
48
             }
49
        }
50
        {
51
           \prg_return_true:
52
        }
53
     }
```

(End of definition for \pdfmeta\_standard\_verify:nnTF. This function is documented on page 2.)

Now we setup a number of handlers.

The first actually ignores the user values and tests against the current pdf version. If this is smaller than the minimum we report a failure. #1 is the user value, #2 the reference value from the standard.

\_standard\_verify\_handler\_min\_pdf\_version:nn

(End of definition for \\_\_pdfmeta\_standard\_verify\_handler\_min\_pdf\_version:nn.)

The next is the counter part and checks that the version is not to high

\_standard\_verify\_handler\_max\_pdf\_version:nn

```
%
4 \cs_new_protected:Npn \__pdfmeta_standard_verify_handler_max_pdf_version:nn #1 #2
5 {
6    \pdf_version_compare:NnTF >
6    { #2 }
6     {\prg_return_false:}
6     {\prg_return_true:}
7 }
```

 $(End\ of\ definition\ for\ \verb|\__pdfmeta_standard_verify_handler_max_pdf_version:nn.)$ 

The next checks if the user value is in the list and returns a failure if not.

```
ta_standard_verify_handler_named_actions:nn
```

a standard verify handler annot action A:nn

This check is probably not needed, but for completeness

dard verify handler outputintent subtype:nn

#### 3.1.3 Enforcing requirements

A number of requirements can sensibly be enforced by us.

**Annot flags** pdf/A require a number of settings here, we store them in a command which can be added to the property of the standard:

 $(End\ of\ definition\ for\ \_pdfmeta\_standard\_verify\_handler\_outputintent\_subtype:nn.)$ 

```
90 \cs_new_protected:Npn \__pdfmeta_verify_pdfa_annot_flags:
91
    {
92
      \bitset_set_true:Nn \l_pdfannot_F_bitset {Print}
      \bitset_set_false: Nn \l_pdfannot_F_bitset {Hidden}
93
      \bitset_set_false: Nn \l_pdfannot_F_bitset {Invisible}
94
      \bitset_set_false: Nn \l_pdfannot_F_bitset {NoView}
95
      \pdfannot_dict_put:nnn {link/URI}{F}{ \bitset_to_arabic:N \l_pdfannot_F_bitset }
96
      \pdfannot_dict_put:nnn {link/GoTo}{F}{ \bitset_to_arabic:N \l_pdfannot_F_bitset }
97
      \pdfannot_dict_put:nnn {link/GoToR}{F}{ \bitset_to_arabic:N \l_pdfannot_F_bitset }
      \pdfannot_dict_put:nnn {link/Launch}{F}{ \bitset_to_arabic:N \l_pdfannot_F_bitset }
      \pdfannot_dict_put:nnn {link/Named}{F}{ \bitset_to_arabic:N \l_pdfannot_F_bitset }
100
    }
101
```

At begin document this should be checked:

```
\hook_gput_code:nnn {begindocument} {pdf}
       \pdfmeta_standard_verify:nF { annot_flags }
104
        { \__pdfmeta_verify_pdfa_annot_flags: }

# 3.1.5 Colorprofiles and Output intents

The following provides a minimum of interface to add a color profile and an output intent need for PDF/A for now. There will be need to extend it later, so we try for enough generality.

Adding a profile and an intent is technically easy:

1. Embed the profile as stream with

```
\pdf object unnamed write:nn{fstream} {{/N~4}{XXX.icc}}
```

2. Write a /OutputIntent dictionary for this

```
\pdf_object_unnamed_write:ne {dict}
{
   /Type /OutputIntent
   /S /GTS_PDFA1 % or GTS_PDFX or ISO_PDFE1 or ...
```

```
/DestOutputProfile \pdf_object_ref_last: % ref the color profile
/OutputConditionIdentifier ...
... %more info
```

3. Reference the dictionary in the catalog:

```
\pdfmanagement_add:nne {Catalog}{OutputIntents}{\pdf_object_ref_last:}
```

But we need to do a bit more work, to get the interface right. The object for the profile should be named, to allow l3color to reuse it if needed. And we need container to store the profiles, to handle the standard requirements.

\g\_pdfmeta\_outputintents\_prop

This variable will hold the profiles for the subtypes. We assume that every subtype has only only color profile.

```
291 \prop_new:N \g__pdfmeta_outputintents_prop
(End\ of\ definition\ for\ \verb+\g_-pdfmeta_outputintents_prop.)

\\_pdfmeta\_embed\_colorprofile:n
\ pdfmeta write outputintent:nn

The commands embed the profile, and write the dictionary and add it to the catalog. The first command should perhaps be moved to l3color as it needs such profiles too. We used named objects so that we can check if the profile is already there. This is not full proof if pathes are used.

If an output intent is required for pdf/A we need to ensure, that the key of default
subtype has a value, as default we take sRGB.icc. Then we loop but take always the
same profile.

```

#### 4.3.3 Date and time handling

( $End\ of\ definition\ for\ \\_pdfmeta\_xmp\_indent:\ and\ others.$ )

If the date is given in PDF format we have to split it to create the XMP format. We use a precompiled regex for this. To some extend the regex can also handle incomplete dates.

```
\l__pdfmeta_xmp_date_regex
                                                                                  \verb| 'regex_new:N  | l_pdfmeta_xmp_date_regex| \\
                                                                                  537 \regex_set:Nn \l__pdfmeta_xmp_date_regex
                                                                                             \{D: (\d\{4\}) (\d\{2\}) (\d\{2\})? (\d\{2\})? (\d\{2\})? (\d\{2\})? (\d\{2\}) (\d\{2\}))? (\d\{2\}))? (\d\{2\}) (\d\{2\}))? (\d\{2\}))? (\d\{2\}) (\d\{2\}))? (\d\{2
                                                                                (End of definition for \l__pdfmeta_xmp_date_regex.)
                                                                              This command takes a date in PDF format, splits it with the regex and stores the captures
\__pdfmeta_xmp_date_split:nN
                                                                                in a sequence.
                                                                                          \cs_new_protected:Npn \__pdfmeta_xmp_date_split:nN #1 #2 %#1 date, #2 seq

         }
            __pdfmeta_xmp_date_split:VN #2 #3
584
585
    }
586
```

(End of definition for \\_\_pdfmeta\_xmp\_date\_get:nNN.)

#### 4.3.4 UUID

We need a command to generate an uuid

\\_\_pdfmeta\_xmp\_create\_uuid:nN

```
\cs_new_protected:Npn \__pdfmeta_xmp_create_uuid:nN #1 #2
 588
         \str_set:Ne#2 {\str_lowercase:f{\tex_mdfivesum:D{#1}}}
 589
         \str_set:Ne#2
 590
           { uuid:
 591
             \str_range:Nnn #2{1}{8}
 592
             -\str_range: Nnn#2{9}{12}
 593
             -4\str_range:Nnn#2{13}{15}
             -8\str_range:Nnn#2{16}{18}
             -\str_range:Nnn#2{19}{30}
 596
 597
      }
 598
(End\ of\ definition\ for\ \_pdfmeta\_xmp\_create\_uuid:nN.)
```

#### 4.3.5 Purifying and escaping of strings

\\_\_pdfmeta\_xmp\_sanitize:nN

We have to sanitize the user input. For this we pass it through \text\_purify and then replace a few special chars.

```
\cs_new_protected:Npn \__pdfmeta_xmp_sanitize:nN #1 #2
600 %#1 input string, #2 str with the output
601
      \group_begin:

#### 4.5 Filling the packet

This tl var that holds the whole packet

```
\g__pdfmeta_xmp_packet_tl

635 \tl_new:N \g__pdfmeta_xmp_packet_tl

(End of definition for \g__pdfmeta_xmp_packet_tl.)
```

#### 4.5.1 Helper commands to add lines and lists

This is the most basic command. It is meant to produce a line and will use the current \ pdfmeta xmp add packet chunk:n indent. \cs\_new\_protected:Npn \\_\_pdfmeta\_xmp\_add\_packet\_chunk:n #1 637 \tl\_gput\_right:Ne\g\_\_pdfmeta\_xmp\_packet\_tl 638 639  $\_{pdfmeta\_xmp\_indent: \exp\_not:n{#1}$ 643 \cs\_generate\_variant:Nn \\_\_pdfmeta\_xmp\_add\_packet\_chunk:n {e} (End of definition for \\_\_pdfmeta\_xmp\_add\_packet\_chunk:n.) This is the most basic command. It is meant to produce a line and will use the current  $\verb|\__pdfmeta_xmp_add_packet_chunk:nN|$ indent. 644 \cs\_new\_protected:Npn \\_\_pdfmeta\_xmp\_add\_packet\_chunk:nN #1 #2 645 \tl\_put\_right:Ne#2 646 647  $\_{pdfmeta\_xmp\_indent: \exp\_not:n{#1}$ 648 649 650 651 \cs\_generate\_variant:Nn \\_\_pdfmeta\_xmp\_add\_packet\_chunk:nN {eN}  $(End\ of\ definition\ for\ \_\_pdfmeta\_xmp\_add\_packet\_chunk:nN.)$ \ pdfmeta xmp add packet open:nn This commands opens a xml structure and increases the indent. \cs\_new\_protected:Npn \\_\_pdfmeta\_xmp\_add\_packet\_open:nn #1 #2 %#1 prefix #2 name \_\_pdfmeta\_xmp\_add\_packet\_chunk:n {<#1:#2>} \\_\_pdfmeta\_xmp\_incr\_indent: } \cs\_generate\_variant:Nn \\_\_pdfmeta\_xmp\_add\_packet\_open:nn {ne} (End of definition for \\_\_pdfmeta\_xmp\_add\_packet\_open:nn.) This commands opens a xml structure too but allows also to give an attribute. \ pdfmeta xmp add packet open attr:nnn \cs\_new\_protected:Npn \\_\_pdfmeta\_xmp\_add\_packet\_open\_attr:nnn #1 #2 #3 %#1 prefix #2 name #3 attr 659 660 \\_\_pdfmeta\_xmp\_add\_packet\_chunk:n {<#1:#2~#3>} 661 \\_\_pdfmeta\_xmp\_incr\_indent: 663 \cs\_generate\_variant:Nn \\_\_pdfmeta\_xmp\_add\_packet\_open\_attr:nnn {nne} (End of definition for \\_\_pdfmeta\_xmp\_add\_packet\_open\_attr:nnn.) This closes a structure and decreases the indent. \\_pdfmeta\_xmp\_add\_packet\_close:nn \cs\_new\_protected:Npn \\_\_pdfmeta\_xmp\_add\_packet\_close:nn #1 #2 %#1 prefix #2:name 666 \\_\_pdfmeta\_xmp\_decr\_indent: 667 \\_\_pdfmeta\_xmp\_add\_packet\_chunk:n {</#1:#2>} 668 669

```
(End of definition for \__pdfmeta_xmp_add_packet_close:nn.)
```

\\_\_pdfmeta\_xmp\_add\_packet\_line:nnn

This will produce a full line with open and closing xml. The content is sanitized. We test if there is content to be able to suppress data which has not be set.

\ pdfmeta xmp add packet line:nnnN

This will produce a full line with open and closing xml and store it in the given tl-var. This allows to prebuild blocks and then to test if there are empty. The content is sanitized. We test if there is content to be able to suppress data which has not be set.

\ pdfmeta xmp add packet line attr:nnnn

A similar command with attribute

\\_pdfmeta\_xmp\_add\_packet\_line\_default:nnnn

```
}
     706
     707

#### 4.5.2 Building the main packet

\\_\_pdfmeta\_xmp\_build\_packet:

This is the main command to build the packet. As data has to be set and collected first, it will be expanded rather late in the document.

748 \cs\_new\_protected:Npn \\_\_pdfmeta\_xmp\_build\_packet:

```
{
 749
Get the main languages
       \tl_set:Ne \l__pdfmeta_xmp_doclang_tl {\GetDocumentProperties{document/lang}}
 750
       \tl_set:Ne \l__pdfmeta_xmp_metalang_tl {\GetDocumentProperties{hyperref/pdfmetalang}}
 751
       \tl_if_blank:VT \l__pdfmeta_xmp_metalang_tl
 752
        { \cs_set_eq:NN \l__pdfmeta_xmp_metalang_tl\l__pdfmeta_xmp_doclang_tl}
 753
we preprocess a number of data to be able to suppress them and their schema if there
are unused. Currently only done for iptc
       \__pdfmeta_xmp_build_iptc_data:N \l__pdfmeta_xmp_iptc_data_tl
 755
       \tl_if_empty:NT \l__pdfmeta_xmp_iptc_data_tl
 756
         {
            \seq_remove_all:Nn \l__pdfmeta_xmp_schema_seq { Iptc4xmpCore }
 757
 758
The start of the package. No need to try to juggle with catcode, this is fix text
         \__pdfmeta_xmp_add_packet_chunk:e
          {<?xpacket~begin="\_pdfmeta_xmp_generate_bom:"~id="W5M0MpCehiHzreSzNTczkc9d"?>}
 760
 761
         \__pdfmeta_xmp_add_packet_open:nn{x}{xmpmeta~xmlns:x="adobe:ns:meta/"}
           \_{\tt pdfmeta\_xmp\_add\_packet\_open:ne{rdf}}
 762
            {RDF~xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns\c_hash_str"}
 763
The rdf namespaces
           \__pdfmeta_xmp_add_packet_open_attr:nne
 764
             {rdf}{Description}{rdf:about="" \g_pdfmeta_xmp_xmlns_tl}
 765
The extensions
             \__pdfmeta_xmp_add_packet_open:nn{pdfaExtension}{schemas}
              \__pdfmeta_xmp_add_packet_open:nn {rdf}{Bag}
 767
               \seq_map_inline: Nn \l__pdfmeta_xmp_schema_seq
 768
 769
                     \tl_use:c { g__pdfmeta_xmp_schema_##1_tl }
 771

```

#### Building the chunks: rdf namespaces 4.6

This is the list of external names spaces. They are rather simple, and we store them directly into a string. Special chars should be escaped properly, see e.g. \c\_hash\_str for the hash.

\g\_\_pdfmeta\_xmp\_xmlns\_tl \g\_\_pdfmeta\_xmp\_xmlns\_prop The string will hold the prepared chunk, the prop stores the name spaces so that one can

```
check on the user level for duplicates.
                                795 \str_new:N \g__pdfmeta_xmp_xmlns_tl
                                796 \prop_new:N \g__pdfmeta_xmp_xmlns_prop
                               (End of definition for \g_pdfmeta_xmp_xmlns_tl and \g_pdfmeta_xmp_xmlns_prop.)
 _pdfmeta_xmp_xmlns_new:nn
\__pdfmeta_xmp_xmlns_new:ne
                                   \cs_new_protected:Npn \__pdfmeta_xmp_xmlns_new:nn #1 #2
                                797
                                798
                                     {
                                       \prop_gput:Nnn \g__pdfmeta_xmp_xmlns_prop {#1}{#2}
                                799
                                       \tl_gput_right:Ne \g__pdfmeta_xmp_xmlns_tl
                                800
                                801
                                            \__pdfmeta_xmp_indent:n{4} xmlns:\exp_not:n{#1="#2"}
                                802
                                803
                                805 \cs_generate_variant:Nn \__pdfmeta_xmp_xmlns_new:nn {ne}
                               (End of definition for \__pdfmeta_xmp_xmlns_new:nn.)
                                   Now we fill the data. The list is more or less the same as in hyperxmp

# 4.7 Building the chunks: Extensions

In this part local name spaces or additional names in a name space can be declared. A "schema" declaration consist of the declaration of the name, uri and prefix which then surrounds a bunch of property declarations. The current code doesn't support all syntax options but sticks to what is used in hyperxmp and pdfx. If needed it can be extended later.

\l\_\_pdfmeta\_xmp\_schema\_seq

This variable will hold the list of prefix so that we can loop to produce the final XML

```
\verb|\scale=| \scale=| \scale=|
```

 $(End\ of\ definition\ for\ \l_pdfmeta_xmp_schema_seq.)$ 

\\_pdfmeta\_xmp\_schema\_new:nnn

With this command a new schema can be declared. The main tl contains the XML wrapper code, it then includes the list of properties which are created with the next command.

```
\cs_new_protected:Npn \__pdfmeta_xmp_schema_new:nnn #1 #2 #3
     %#1 name #2 prefix, #3 text
830
831
       \seq_put_right:Nn \l__pdfmeta_xmp_schema_seq { #2 }
832
       \tl_new:c { g__pdfmeta_xmp_schema_#2_tl }
833
       \tl_new:c { g__pdfmeta_xmp_schema_#2_properties_tl }
834
       \tl_gput_right:cn { g__pdfmeta_xmp_schema_#2_tl }
835
         {
836
           \__pdfmeta_xmp_add_packet_open_attr:nnn{rdf}{li}{rdf:parseType="Resource"}
837
            \__pdfmeta_xmp_add_packet_line:nnn {pdfaSchema}{schema}{#1}
838
            \__pdfmeta_xmp_add_packet_line:nnn {pdfaSchema}{prefix}{#2}
839

858
             \__pdfmeta_xmp_add_packet_line:nnn {pdfaProperty}{description}{#5}
859
           \__pdfmeta_xmp_add_packet_close:nn{rdf}{li}
860
861
    }
862
```

 $(End\ of\ definition\ for\ \verb|\__pdfmeta_xmp_property_new:nnn.|)$ 

\ pdfmeta xmp add packet field:nnn

This adds a field to a schema.

(End of definition for \\_\_pdfmeta\_xmp\_add\_packet\_field:nnn.)

#### 4.7.1 The extension data

The list of extension has been reviewed and compared with the list of namespaces which can be used in  $pdf/A-1^7$ 

[1] https://www.pdfa.org/wp-content/uploads/2011/08/tn0008\_predefined\_xmp\_properties\_in\_pdfa-1\_2008-03-20.pdf and the content of the namespaces as listed here [2] https://developer.adobe.com/xmp/docs/XMPNamespaces/pdf/

pdf property: Trapped. We ignore it, it seems to validate without it.

**xmpMM** properties DocumentID, InstanceID, VersionID, Renditionclass declared by hyperxmp. Properties InstanceID and OriginalDocumentID declared by pdfx (pdfx.xmp) With the exception of OriginalDocumentID all are already allowed and predefined.

**pdfaid** properties part and conformance are declared by hyperxmp, but no here as already in http://www.aim.org/pdfa/ns/id/. But we declare year so that it can be used also with older A-standards.

pdfaid~(schema)

```
\__pdfmeta_xmp_schema_new:nnn

{PDF/A~Identification~Schema}

{pdfaid}

{http://www.aiim.org/pdfa/ns/id/}
```

<sup>&</sup>lt;sup>7</sup>While A-1 builds on PDF 1.4 and so it probably no longer relevant, it is not quite clear if one can remove this for A-2 and newer, so we stay on the safe side.

pdfuaid here we need (?) to declare the property "part" and "rev".

#### pdfuaid~(schema)

```
892
         \__pdfmeta_xmp_schema_new:nnn
            {PDF/UA~Universal~Accessibility~Schema}
893
            {pdfuaid}
894
            {http://www.aiim.org/pdfua/ns/id/}
895
         \__pdfmeta_xmp_property_new:nnnnn
896
            {pdfuaid}
897
            {part}
898
            {Integer}
            {internal}
            {Part~of~ISO~14289~standard}
902
         \__pdfmeta_xmp_property_new:nnnnn
            {pdfuaid}
903
            {rev}
904
            {Integer}
905
            {internal}
906
            {Revision~of~ISO~14289~standard}
907
```

 $(\mathit{End}\ of\ definition\ for\ pdfuaid \texttt{-} (\texttt{schema}).\ \mathit{This}\ \mathit{function}\ \mathit{is}\ \mathit{documented}\ \mathit{on}\ \mathit{page}\ \ref{eq:constraint}.)$ 

pdfx According to [1] not an allowed schema, but it seems to validate and allow to set the pdf/X version, hyperxmp declares here the properties GTS\_PDFXVersion and GTS\_PDFXConformance. Ignored as only relevant for older pdf/X version not supported by the pdfmanagement.

pdfxid we set this so that we can add the pdf/X version for pdf/X-4 and higher

#### pdfxid~(schema)

```
\__pdfmeta_xmp_schema_new:nnn
908
             {PDF/X~ID~Schema}
909
             {pdfxid}
910
             {http://www.npes.org/pdfx/ns/id/}
911
        \__pdfmeta_xmp_property_new:nnnnn
912
             {pdfxid}
             {GTS_PDFXVersion}
915
             {Text}
             {internal}
916
             {ID~of~PDF/X~standard}
917
```

(End of definition for pdfxid~(schema). This function is documented on page ??.)

declarations The PDF Declarations mechanism allows creation and editing software to declare, via a PDF Declaration, a PDF file to be in conformance with a 3rd party specification or profile that may not be related to PDF technology. Their specification is for example described in https://pdfa.org/wp-content/uploads/2019/09/PDF-Declarations.pdf.

If declarations are added to the XMP-metadata they need (for pdf/A compliancy) a schema declaration. We do not add it by default but define here a command to enable it. (This can be done in the document preamble as xmp is built only at the end.)

#### 4.8.3 Standards

These functions are documented on page ??.)

The metadata for standards are taken from the pdfstandard key of \DocumentMetadata. The values for A-standards are taken from the property, X and UA are currently taken from the document container, this should be changed when merging of standards are possible.

\ pdfmeta xmp build standards:

```
